ADVENTURER / EXPERIENCE DESIGN

Less scrolling.
More out there.

A trip-first mobile experience for discovering routes, preparing thoughtfully, recording real journeys and shaping memories into stories — without copying another platform's social identity.

PRODUCT PRINCIPLE	PRIMARY LOOP
Adventure is the main event. Community and storytelling should support the journey, never compete with route planning, field safety and personal privacy.	Discover → Plan → Prepare → Go & record → Reflect → Share by choice

THE EXPERIENCE MAP

01	02	03	04	05	06	07
BASECAMP	FIELD ATLAS	ROUTE BRIEF	FIELD MODE	STORY STUDIO	FINAL REVIEW	TRAIL SETTINGS

Visual direction: deep navy surfaces, restrained warm-orange actions, soft mint for safe/completed states, terrain-inspired line work and original vector landscape illustrations. The app's own vocabulary is Basecamp, Field Atlas, Route Brief, Field Mode and Story Studio.

SCREEN ARCHITECTURE

Seven screens, one connected journey

ID / SCREEN	INTENT	UX STRUCTURE	VALIDATION QUESTION
01 BASECAMP / HOME	A launchpad, not an endless feed.	One dominant “Build an adventure” action, with Field Mode and Story Studio as clear secondary paths. A resume card shows saved plan progress and incomplete prep steps.	Success: a new user identifies the next useful action in under a few seconds.
02 FIELD ATLAS / EXPLORE	Map-led discovery with honest provenance.	Search by place, activity or idea; filter by terrain; inspect route cards; save a route to a trip board. Map lines and sample estimates are visibly labelled as candidate/unverified.	Success: users know what is verified, what is sample data and how to inspect route detail.
03 ROUTE BRIEF	Turn a route candidate into a plan.	Show route chapters/stops, distance and time estimates, checklists, return planning and unknown access/condition notes. Choose “Save to trip board” or “Use this plan.”	Success: exploring a route never silently starts recording.
04 FIELD MODE	Calm, glanceable and stateful.	Ready → Active → Paused → Finished. Large Start/Pause/Resume/Finish controls, concise data, chosen trusted contact and return plan. No invented sensor readings.	Success: user always knows whether recording is active and what data is live.

Visual rhythm

Use a single high-priority action per screen, short micro-labels for secondary context, generous touch targets, and restrained card outlines. The home should not compete with active navigation. Field mode should reduce complexity further.

SCREEN ARCHITECTURE

ID / SCREEN	INTENT	UX STRUCTURE	VALIDATION QUESTION
05 STORY STUDIO	Make a trip artifact, not a generic post.	Choose route journal, short film, photo essay or trip guide; pick tone; edit title/caption; select audience; mask route start/end and delay location context.	Success: edits remain editable and privacy is understandable before review.
06 FINAL REVIEW	A meaningful consent checkpoint.	Reflect current title/caption and summarize audience, route exposure and media permissions. Block the final action until three explicit review checks are complete.	Success: users can correct any choice before anything is shared.
07 TRAIL SETTINGS	Preferences shape utility and calm.	Multiple activity modes, explicit voice activation behaviour, quiet hours, feed mood, exact-coordinate controls, data export/deletion and privacy check-up.	Success: controls are discoverable and not buried behind ambiguous social settings.

CRITICAL WORKFLOWS

The paths that must work end-to-end

A · FIND AND PREPARE

Basecamp → Field Atlas → Search / Filter → Route card → Route Brief → Save trip or Use plan → Field Mode

The user can discover, inspect source status, check prep tasks and select a clear next action.

B · RECORD AND REFLECT

Basecamp → Field Mode → Start → Pause / Resume → Finish → Story Studio → Edit → Final Review

Active, paused and finished states are distinct. Only actual, permitted sensor data is shown as real.

C · SHARE DELIBERATELY

Story Studio → format/tone → title/caption → audience → route masking → delayed location → Final Review → 3 confirmations → save/publish

The preview reflects edits, privacy is summarised, and the final action remains blocked until confirmations are checked.

Workflow state model

DISCOVER	PLAN	PREPARE	FIELD	REFLECT	SHARE
Search + compare	Stops + route chapters	Kit + return + contact	Record state + data quality	Select moments + edit	Audience + location review

Prototype note: interactions only run locally in a browser. There is no login, backend, real publishing, GPS, map routing, live emergency dispatch or trusted-contact delivery in this design concept.

A recognisable Adventurer identity

FIELD NAVY #0A1119	SLATE PANEL #111D28 / #162532	TRAIL ORANGE #FF8B43	SAFE MINT #A8DFC4	FIELD TEXT #F4F1E9

SURFACES	Dark navy / slate; use elevation sparingly, with thin outlines and card grouping only when it supports a decision.
ACTIONS	Warm orange identifies the single primary action and selected state. Mint identifies completion or a privacy-protective state. Red is reserved for a real warning.
TYPE	Readable system sans-serif, clear headline hierarchy. Small uppercase text only for metadata, not long instructions.
SHAPES	10–16 px web-card radius for concept; native Compose implementation should map to consistent Material-aligned shapes and 44 dp+ controls.
IMAGERY	Original or properly licensed adventure photography, terrain illustrations and route diagrams. Do not reuse competitor screenshots, icons, brand marks, unique layouts or branded asset sets.
NAVIGATION	Five destinations: Basecamp, Discover, Field, Studio, Me. Route Brief is within the Discover/plan journey; no social tab is required for the core job.

Safety, privacy and accessibility requirements

- No fabricated speed, altitude, GPS track, road status, emergency dispatch, contact alert, live booking or public publishing.
- Label provider source, freshness, route candidate status, access unknowns and estimates. Never imply a checklist guarantees a safe trip.
- Field Mode uses large glanceable controls; complex editing stays outside an active moving session. Do not rely on swipe-only finish or publish gestures.
- Use text labels and icons together; support TalkBack/content descriptions, logical focus order, scalable font sizes and strong contrast in native Android.
- User controls exact-coordinate exposure, route history retention, audience, voice/microphone activation and upload consent.
- Production share/publish requires authenticated backend enforcement, clear storage/retention disclosure, safe access rules and explicit outcomes/errors.

IMPLEMENTATION & VALIDATION

A practical path from concept to Android

1 · Foundations	Compose theme/tokens, typography, buttons, input styles, navigation semantics, state models and accessibility pass.
2 · Planning	Connect Basecamp to existing Explore & Plan / Room model; implement route cards, itinerary, checklists and source status.
3 · Field Mode	Implement a session state machine against the existing recorder; sensor validity and placeholder states must be distinct. Test lifecycle and permission denial.
4 · Story Studio	Connect selected trip segments and media to the existing Story Studio workflow; keep edits reversible and expose upload consent / local export.
5 · Privacy & publish	Create typed share draft and preview; enforce the three review confirmations, route masking, audience choices and server-side access policies. Add integration tests.
6 · Evaluate	Usability testing, accessibility, physical-device validation and release checklist. Visual completion alone is not production readiness.

Usability test (3–5 people)

Ask participants without coaching to: (1) find and save a route, (2) spot sample/unverified route information, (3) start, pause and finish a demo session, (4) make a playful story, (5) mask route start/end and delay location, and (6) complete review. Measure completion, hesitation, misunderstood labels, privacy controls missed and mistaken assumptions that a demo action is connected.

Definition of done for this concept

CHECK	ACCEPTANCE
Navigation	Primary routes among Basecamp, Atlas, Route Brief, Field Mode and Studio are reachable and understandable.
Editing	Title and caption changes appear in the review preview.
Privacy	Audience and location decisions are visible before the final action.
Consent gate	Final action stays disabled until all three review confirmations are checked.
Disclosure	All mock route/sensor/publishing actions are labelled as prototype behaviour.

SOURCE ALIGNMENT

How this concept uses your reference

Your uploaded 2-page “Adventurer UI/UX Workflow Reference & Prototype Review” specifies a dark navy / warm orange visual direction; home, ride storytelling, exploration, story creation, creator/profile and community preferences; a critical Home→Ride, Ride→Finish→Create, Create→Preview→Publish and Explore→Route→Ride flow; and explicit prototype boundaries. This design keeps those functional needs but recasts the UI as Basecamp / Field Atlas / Route Brief / Field Mode / Story Studio, with original vector illustrations and a trip-first interaction model. The supplied reference’s notes about simulated data and the three publish confirmations are retained as clear guardrails.

This document describes a design proposal, not an implemented Android release. The responsive HTML concept is the clickable companion; its values are sample content and it does not connect to production services.
